AB The film consists of a support having a **photosensitive** layer containing Ag halide particles, organic Ag salts, reducing agents, and binders; a

layer neighboring the **photosensitive** layer; a backing layer; and a protective layer for the backing layer. In the film, the **photosensitive** layer or its neighboring layer contains 1H-indazole derivs. having substitution groups (excluding nitro group) at positions 4-7, and optionally contain phthalazine and/or polyhalomethane derivs. as well. Preferable Markush I (R1 = halogen, cyano, OH, substituted oxy, substituted amino, aromatic, heterocycle, (un)substituted C1-60 alkyl, alkenyl, or alkynyl; n = integer of 1-4; R1 may form a ring when n ≥ 2 and when neighboring) for the indazole derivative is given.

AB The material comprises a support having thereon (A) a **photosensitive** layer containing a **photosensitive** Ag halide, a reducing agent, and a binder and (B) a protective layer containing a fluorine compound, a matting agent, and a binder, in which the binder of the **photosensitive** or the protective layer is hardened with the hardener I or II [Z1, Z2 = atoms required to form a (substituted) 5- or 6-membered ring; L1 = bivalent linkage to link Z1 to Z2; m = 0, 1; upon m = 1, n = 0, 1]. It is developed at 80-120° by a heated drum or roller on which silicone rubber surface containing an iron oxide having 20-90 hardness (defined by A hardness measured by a durometer) and unevenness with 0.5-8 μm depth and 10-1000 number per/mm.. It shows improved abrasion resistance and improved printout and dirt prevention.

AB An object of the present invention is to provide a heat-developable **photosensitive** material of improved fluctuation of photog. performance (sensitivity, Dmin) arisen from fluctuation of development temperature condition (temperature, time) and storage time after heat development.

According to the present invention, there is provided a heat-developable **photosensitive** material, wherein the **photosensitive** material comprises, on a support, an image-forming layer containing at least (a) non-**photosensitive** organic silver salt, (b) **photosensitive** silver halide, (c) a reducing agent, and (d) a binder, and a protective layer on the image-forming layer, polymer latexes are used as binders of the image-forming layer and the protective layer, and the **photosensitive** material further comprises, on the image-forming layer side, (e) a nucleating agent and (f) one or more compds. represented by formula I (Z1, Z2 = a halogen atom; X1 = H, an electron withdrawing group; Y1 = -CO- group or -SO2- group; Q = an arylene

AB The former material has layers containing a nonphotosensitive organic Ag salt, its reducing agent, and a binder on a support, in which at least one of the layers contains a compound X1X2X3CYLZ (X1, 2 = halogen; X3 = H, halogen, monovalent substituent; L = divalent organic group; Y = heteroatom-containing divalent organic group, single bond; Z = acidic functional group, its salt). The latter material has layers containing a **photosensitive** Ag halide salt, a binder, and the compound on a support. The material gives good images with excellent storage stability.
